

AVIACIOM Fuelling Equipment

Sampling, Vent or Drain unit

Product Information

Introduction

About Mann Tek

Mann Teknik AB is a Swedish company located in Mariestad, Sweden.

Mann Teknik AB produces and markets products for safe and environmentally friendly handling of aggressive fluids for the chemical and petrochemical industries.

The main product is the Dry Disconnect Couplings, DDCouplings®, for spill free liquid handling. The products are marketed through independent representatives in more than 30 countries.

Mann Teknik AB have many years of experience in designing, producing and marketing of DDCouplings® all since 1977.

Mann Teknik AB has shown a high rate of growth during the past years and is now a major player in its specialised field of operation. This is due to a determined expansion into growing markets and recognition by customers of the robust design and reliable quality of the products.

Mann Teknik AB are certified to ISO9001:2000. The products are CE-labeled. The main products are certified to PED, the European Pressure Equipment Directive and ATEX, the European directive for Equipment intended for use in Potentially Explosive Atmospheres.

The products are produced in accordance with several important standards, e.g. the NATO STANAG 3756

General information - Sampling, Vent or Drain unit

Why use the Mann -Tek Sampling, Vent or Drain Units?

- Take a sample to check the quality of fuel in a hydrant system on airports.
- Draining of condensate and venting out of hydrant systems.
- Preventing pressure drop while sampling by lock valves with fire safe function.
- Fits into standard 18" external pipe pits with ANSI 6" 300 psi flange.
- "Easy to Use" design saves time and minimizes health risks.
- Relibilty and easy servicing saves your investment.
- Approved for safe handling by independent "Notified Body".
- Connection by 70 mm dry disconnect coupling acc to STANAG 3756.
- Dry disconnect coupling equipped with built in Pressure Relief and Bleeding Valve function.

Applications, Note and Operation procedure

Application

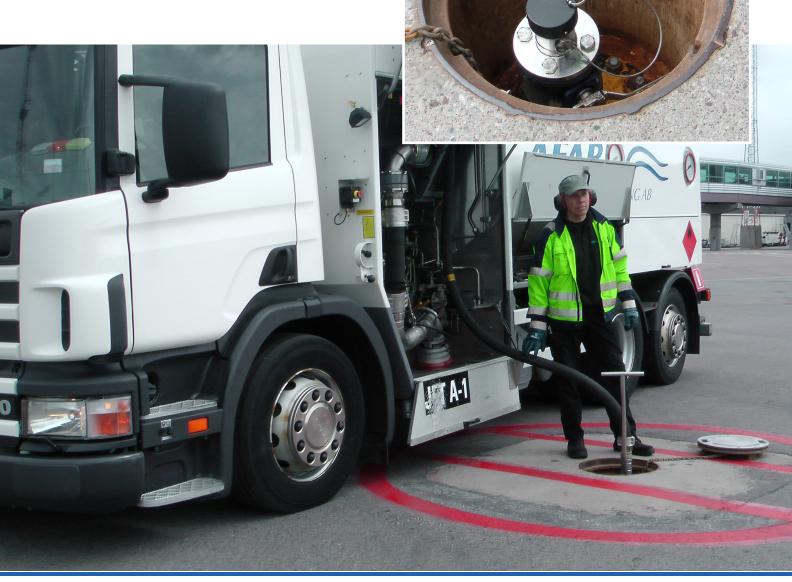

Modern airports are using an underground pipeline, for the fuelling of aircrafts. Mobile dispensers are the interface between this hydrant system and the airplane.

They are containing pumps, valves, hoses and couplings to pump the fuel from the hydrant system to the plane.

The pipelines are designed with high points, low points and convenient points. If there is condensate in the pipeline, which is heavier than the fuel, it will sink to the low points.

Encapsulated air will rise to the high points. Neither water nor air is very welcome in the pipeline. To get them out of the pipeline there are sampling units at each low point for draining and at each high point for venting.

At the convenient point the sampling units are used to take samples of the fuel to check the quality.

Applications, Note and Operation procedure

Applications

- Sampling installed at a convenient point on a riser from the main hydrant line
- Venting installed at a high point in the hydrant line
- Draining installed at a low point in the hydrant line

Note

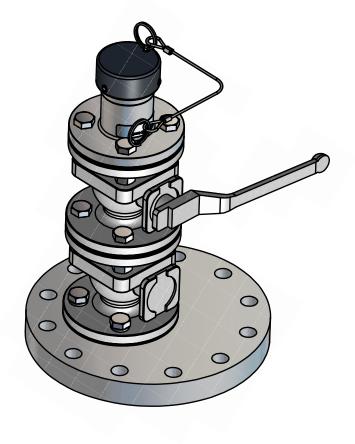

- Only one operation handle is supplied for Ball Valves. The lower Valve is left open at all times unless the upper Valve is to be removed for service.
- Upper Valve must be fully closed before operating.

Operation procedure

- 1. Ensure upper Valve is fully closed
- 2. Remove Dust Cap.
- **3.** Connect 1½" Hose Unit to the Tank Unit. With exceptionally high pressure, after i.e. thermal expansion, the overpressure equalizes automatically after few seconds. The coupling procedure can then be continued.

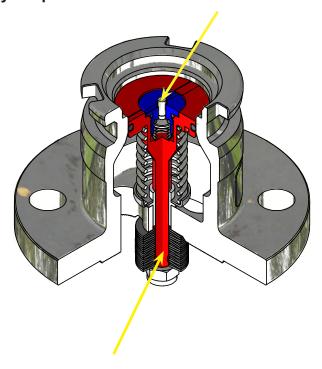

IMPORTANT: The overpressure/medium is kept within the system

- 4. Open Upper Valve
- 5. Take required sample (or Vent/Drain).
- **6.** Fully close Upper Valve.
- 7. Uncouple Hose Unit
- 8. Replace Dust Cap

Tank Unit with Pressure Relief and Equalizing Valve

Pressure differences in the system reduces by the piston stroke forward or backward

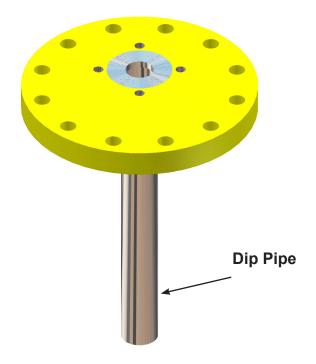

Pressure Relief Valve opens at a predetermined pressure at an acceptable and riskless limit

Function: When you start to connect the Hose unit (coupler), the Hose unit piston moves forward and pushes on the pressure equalizing valve piston.

Now the pressure equalizing valve is open and the pressure between the Tank unit and the Hose unit is equalized. Then you have no problem to proceed with the connection.

You will not have problems to connect the Hose unit when there is fluid under high pressure in the Tank unit or if there is incompressable fluid caught between the valve and the Tank unit.

Option - Flange with Dip Pipe

Flange with Dip Pipe is used for draining water when it's placed at a low point

No part of this leaflet may be reproduced in any form or by any means without permission in writing from the publisher

Option - Dust Cap for Tank Unit

A Dust Cap should be used to prevent the ingress of dirt or water

Composite

Patent No. 000840780-0001

Rubber

Code nr:	Material:
C200E2202	Composite ^{1) 2)}

Mounting instruction

When installing Mann Tek equipment to new pipe work, tanks, etc. ensure the system is free from debris that may be transferred through the coupling. Where the hose or loading arm assembly is the primary static dissipation or earth route, the electrical continuity value of the assembly shall be checked to ensure regulatory compliance. Special attention should be paid to the balancing of loading arms. The weight of the coupling plus transfer media should be taken into account at the specification stage. It is usual for loading arm balance settings to account of weight variations due to differences in the full / empty cycle.

The loading arm should be set to balance in the condition present at the time of connection. For example, should the loading arm be empty at the time of connection then it should be balanced in the empty condition.

The Mann-Tek product can be installed directly in the product line and is ready for use after removing the transport protection. The installation is recommended as follows:

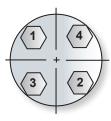

- a. Remove the packaging and the flange protection
- b. Check the coupling for damages before mounting.
- c. To prevent damages during mounting a suitable wrench should be used for the intended bolts and nuts.
- d. Ensure that the product line is empty and all valves are close before you connect the coupling into the line.
- e. Set in all bolts first and tighten them by hand. Then increase the tightening torque in 2 steps up to the recommended value in the following table. Proceed every time according to the sequence shown in g.
- f. Tightening torque¹⁾ for bolts:

Product Information

DDCouplings®

Dry Disconnect Coupling.

1" to 8", PN 16 - PN 25. Aluminium, Brass-Gunmetal, Stainless Steel and PEEK. Other materials on request. According to NATO standard STANAG 3756.

DGCouplings®

Dry Gas Coupling. 1" to 8", PN25. Stainless steel. Other materials on request.

DACouplings,

Dry Aviation Coupling. 2½", PN 10. Main body in Aluminium. **Standards:** ISO 45, MS 24484, NATO STANAG 3105, British Aerospace Spec.

Sampling, Vent or Drain unit

Stainless Steel SS-EN 10 088-1.4404+AT (AISI 316L). Ball Valve in 1.0619 and 1.4301

Full Flow - ballvalves

2" to 4", PN 10, Aluminium. Ballvalve and 2-way Ballvalve. Made for Petroleum Tank Trucks. Variations of flange connections.

Swivel joints

(DIN, ANSI/ASA e.t.c)

3/4" to 10", PN 10 - PN 25.
Aluminium, Brass-Gunmetal,
Stainless Steel.
Other materials on request.
Connection: BSP, NPT. Flanged connection

SBCouplings,

bolt series

Industrial and Marine Safety Break-away, breaking bolts,

Aluminium, Brass, Stainless Steel, 1" to 12", female/male threads and with flanges, with breaking bolts. **Safety Break-away, cable release**

Stainless Steel, PN10 / PN 25. 2" to 4", female threads. 6" to 12", flanged connection

Business Segment Information

Offshore & Marine

Gas (LPG)

Rail tankers

Chemical industry

Tank trucks

Military

Container

Cryogenic Couplings
